

COMP1730/COMP6730

Programming for Scientists

Sequence types, part 2

Announcements

- * Homework 3 marks will be released today.
- * Homework 4 is due tonight (11:55pm).
- * Homework 5 has been released, due next Thursday.
- * Examination details will be coming soon.
- * The course representatives will release another survey soon (link in Wattle forum).
- * Read the Wattle forum.

Lecture outline

- * Lists (recap)
- * Mutable objects & references

Sequence data types (recap)

- * A *sequence* contains $n \geq 0$ values (its *length*), each at an *index* from 0 to $n - 1$.
- * python's built-in sequence types:
 - strings (`str`) contain only characters;
 - lists (`list`) can contain a mix of value types;
 - tuples (`tuple`) are like lists, but immutable.
- * Sequence types provided by other modules:
 - e.g., NumPy arrays (`numpy.ndarray`)

Lists

- * python's `list` is a general sequence type: elements in a `list` can be values of any type.
- * List literals are written in square brackets with comma-separated elements:

```
>>> a_list_of_ints = [2, -4, 2, -8 ]
>>> a_date = [12, "August", 2015]
>>> pairs = [ [ 0.4, True ],
              [ "C", False ] ]

>>> type(pairs)
<class 'list'>
```

Creating lists

```
>>> monday = [18, "July"]
>>> friday = [22, "July"]
>>> [monday, friday]
[[18, "July"], [22, "July"]]
>>> list("abcd")
['a', 'b', 'c', 'd']
>>> list(range(10))
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]
>>> [1/x for x in range(1,6)]
[1.0, 0.5, 0.33333333, 0.25, 0.2]
```

Lists of lists

```
>>> A = [ [1, 2, 3], [4, 5, 6],  
          [7, 8, 9] ]
```

```
>>> A[0]
```

```
[1, 2, 3]
```

```
>>> [1, 2, 3][2]
```

```
3
```

```
>>> A[0][2]
```

```
3
```

- * Indexing and slicing are *operators*
- * Indexing and slicing associate to the left.
`a_list[i][j] == (a_list[i])[j]`.

Lists of lists

```
>>> A[0]
[1, 2, 3]
>>> A[0:1]
[ [1, 2, 3] ]
>>> A[0:1][1:]
[ ]
>>> A[0:1][1]
```

`IndexError: list index out of range`

- * Indexing a list returns an element, but slicing a list returns a list.

Mutable objects and references

Values are objects

- * In python, every value is an *object*.
- * Every object has a unique^(*) identifier.

```
>>> id(1)
136608064
```

(Essentially, its location in memory.)

- * *Immutable* objects never change.
 - For example, numbers (`int` and `float`) and strings.
- * *Mutable* objects can change.
 - For example, lists and arrays.

Immutable objects

- * Operations on immutable objects create new objects, leaving the original unchanged.

```
>>> a_string = "spam"
>>> id(a_string)
3023147264
>>> b_string = a_string.replace('p', 'l')
>>> b_string
'slam'
>>> id(b_string)
3022616448
>>> a_string
'spam'
```

not the same!

Mutable objects

- * A mutable object can be modified yet it's identity remains the same.
- * Lists and arrays can be modified through:
 - element and slice assignment; and
 - modifying methods/functions.
- * `list` and `ndarray` are the only mutable types we have seen so far but there are many other (sets, dictionaries, user-defined classes).

Element & slice assignment

```
>>> a_list = [1, 2, 3]
>>> id(a_list)
3022622348 ←
>>> b_list = a_list
>>> a_list[2] = 0
>>> b_list
[1, 2, 0]
>>> b_list[0:2] = ['A', 'B']
>>> a_list
['A', 'B', 0]
>>> id(b_list)
3022622348 ←
```

the same object!

Modifying list methods

- * `a_list.append(new element)`
- * `a_list.insert(index, new element)`
- * `a_list.pop(index)`
 - `index` defaults to `-1` (last element).
- * `a_list.extend(an iterable)`
- * `a_list.sort()`
- * `a_list.reverse()`
- * Note: Most do not return a value.

Lists contain references

- * Assignment associates a (variable) name with a *reference* to a value (object).
 - The variable still references the same object (unless reassigned) even if the object is modified.
- * *A list contains references to its elements.*
- * Slicing a list creates a new list, but containing references to the same objects (“shallow copy”).
- * Slice assignment *does not copy*.

```
>>> a_list = [1,2,3]
>>> b_list = a_list
>>> a_list.append(4)
>>> print(b_list)
```

Image from pythontutor.com

```
>>> a_list = [1,2,3]
>>> b_list = a_list[:]
>>> a_list.append(4)
>>> print(b_list)
```

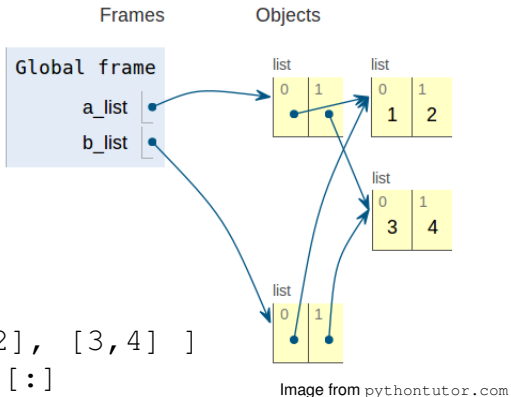

Image from pythontutor.com

```
>>> a_list = [ [1,2], [3,4] ]
>>> b_list = a_list[:]
>>> a_list[0].reverse()
>>> b_list.reverse()
>>> print(b_list)
```

```
>>> a_list = [ [1,2], [3,4] ]
>>> b_list = a_list[:]
>>> a_list[0] = a_list[0][::-1]
>>> b_list.reverse()
>>> print(b_list)
```

Image from pythontutor.com

```
>>> a_list = [1,2,3]
>>> b_list = [4,5,6]
>>> a_list.append(b_list)
>>> c_list = a_list[:]
>>> b_list[0] = 'A'
```

Image from pythontutor.com

Common mistakes

```
>>> a_list = [3,1,2]
>>> a_list = a_list.sort()

>>> a_list = [1,2,3]
>>> b_list = a_list
>>> a_list.append(b_list)

>>> a_list = [[]] * 3
>>> a_list[0].append(1)
```

Shallow vs. deep copy

```
>>> import copy
>>> a_list = [[1,2], [3,4]]
>>> id(a_list)
3054870700
>>> id(a_list[0]), id(a_list[1])
(3054874028, 3073291596)
>>> b_list = a_list[:]
>>> id(b_list)
3072077420
>>> id(b_list[0]), id(b_list[1])
(3054874028, 3073291596)
>>> c_list = copy.deepcopy(a_list)
>>> id(c_list[0]), id(c_list[1])
(3057394764, 3057585932)
```

equal!

not equal!

(Almost) Never use deepcopy!

- * Creating 10,000 copies of a list of 1,000 lists of 10 integers.

	Time	Memory
Shallow copy	0.4s	39.3 MB
Deep copy	305 s	1071 MB
