

#### COMP1730/COMP6730 Programming for Scientists

#### I/O and files

#### Announcements

- \* Homework 5 due Monday, 9:00am
- ★ Homework 5 being marked in labs next week
- Major assignment will be released on Monday next week.
- \* Read the Wattle Forum

#### Outline

- Input and output
- \* Files and directories
- \* Reading and writing text files

## I/O: Input and Output

- A (common) way for a programs to interact with the world.
  - Reading data (keyboard, files, cameras, etc).
  - Writing data (screen, network, speakers, etc).
- \* Scientific computing often means processing or generating large volumes of data.

2016, 2016, 2016, 2016, 2016, 2016, 2016, 2016, 2016, 2016,	07, 07, 07, 07, 07, 07, 07, 07, 07, 07,	01, 02, 03, 04, 05, 06, 07, 08, 09, 10,	2.0, 0.0, 0.0, 4.4, 15.4, 1.0, 0.0, 4.2, 0.0,	1, 1, 1, 1, 1, 1, 1, 1, 1, 1,	$\begin{array}{c} Y \\ Y $	10 -				W	
2016,	07,	11,	10.4,	1,	Y	0 1970 1	980	1990	2000	2010	_

## Terminal I/O

- \* print(...) generates output to the terminal
   (typically, screen).
- input (...) prints a prompt and reads input
   from the terminal (typically, keyboard).
  - input always returns a string.

```
input_str = input("Enter a number: ")
input_int = int(input_str)
```

#### Files and directories

#### What is a file?

- A *file* is a collection of data on secondary storage (hard drive, USB key, network file server).
- \* A program can open a file to read/write data.
- \* Data in a file is a sequence of *bytes* (integer  $0 \le b \le 255$ ).
  - The program reading a file must *interpret* the data (as text, image, sound, etc).
  - python & the operating system (OS) provide support for interpreting data as text.

# Text encoding (recap)

- \* Every character has a number.
- Unicode defines numbers ("code points") for >120,000 characters (in a space for >1 million).

Byte(s)	Code point	Glyph
0100 0101 (69)	69	$ ext{EEE}\mathcal{E}$
1110 0010 (226)		
1000 0010 (130)		
1010 1100 (172)	8364	€€€€

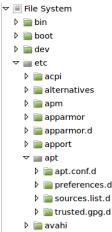

- \* A *text file* contains (encodings of) printable characters (including spaces, newlines, etc).
  - (python) program source code, HTML files, etc.
- \* A *binary file* contains arbitrary data, which may not correspond to printable characters.
  - images, audio/video, word documents.

#### **Directory structure**

- ★ Files on secondary storage are organised into directories (a.k.a. folders).
   ▼ ■ File System
- This is an abstraction provided by the operating system.
  - It will appear differently on different operating systems.
- The directory structure is typically tree-like.

## File path

- \* A *path* is string that identifies the location of a file in the directory structure.
- Consists of directory names with a separator between each; the last name in the path is the name of the file.
- \* Two kinds of paths:
  - Absolute
  - Relative to the current working directory (cwd)

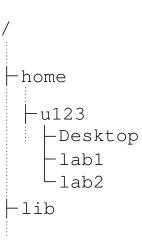

- When running a python file (script mode), the current working directory (cwd) is the directory where that file is.
- If the python interpreter was started in interactive mode (without running a file), the cwd is the directory that it was started from.
- ★ The os module has functions to get (and change) the current working directory.
  - >> import os
  - >> os.getcwd()
  - 'C:\\Users\\Jeffrey\\Desktop ...
  - \\COMP1730\_2021\\Lectures\\Lecture\_16

## Example: Posix (Linux, OSX)

- \* Single directory tree.
  - Removable media and network file systems appear at certain places in the tree.
- \* The separator is '/'
- \* An absolute path starts with a '/'
- \* '...' means the directory above.
- \* File and directory names are *case sensitive*.

If the cwd is /home/u123/lab1 then

prob1.py refers to
/home/u123/lab1/prob1.py

../lab2/prob1.py refers to
/home/u123/lab2/prob1.py

../../lib/libbz2.so
refers to /lib/libbz2.so

/home/u123/Lab1/prob1.py does not exist.

#### **Example: Windows**

- One directory tree for each "drive"; each drive is identified by a letter ('A' to 'Z')
- \* The separator is '  $\ '$ 
  - Must be written '\\' in python string literals.
- \* Absolute path starts with drive letter and ': '
- \* '...' means the directory above.
- \* File and directory names are *not* case sensitive.
- "C:\\Users\\jeff\\test.py"
- "..\\lab1\\exercise1.py"

## Reading and writing text files

## File objects

- \* When we open a file, python creates a *file object* (or "stream" object).
  - The file object is our interface to the file: all reading, writing, etc, is done through methods of this object.
  - The type of file object (and what we can do with it) depends on the *access mode* specified when the file was opened.
  - For example, *text mode* vs. *binary mode*, *read-only*, *write-only*, *read-write* mode, etc.

## Opening a file

\* open(file\_path, access\_mode) opens a
file and returns the file object.

my\_file = open("notes.txt", "r")
first\_line = my\_file.readline()
second\_line = my\_file.readline()
my\_file.close()

- \* Close the file when done!
- \* After calling file\_obj.close(), we can do
   no more read/write calls on file\_obj.

#### Access modes

#### \* access\_mode is a string, made up of flags.

		if the file exists	if it does not exist				
'r'	read only		Error				
'w'	write only	Erases file content	Creates a new (empty)				
			file				
'a'	write only	Appends new content	Creates a new (empty)				
		at end of file	file				
'r+'	read/write	Reads/overwrites	Error				
		from beginning of file	EIIOI				
'w+'	read/write	Evenes file content	Creates a new (empty)				
		Erases file content	file				
'a+'	read/write	Reads/overwrites	Creates a new (empty)				
		starting at end of file	file				
'b'	Open as binary file (default is text)						

#### Caution

- Be careful with write modes. Erased or overwritten files <u>cannot be recovered</u>.
- \* Can we check if an existing file will be overwritten?

Yes!

- os.path.exists(file\_path) returns
   True Or False.
- Catching exceptions (more later in the course).

## **Reading text files**

- \* file\_obj.readline() reads the next line of
   text and returns it as a string, including the
   newline character('\n').
- *file\_obj.read(size)* reads at most *size* characters and returns them as a string.
  - If *size* < 0, reads to end of file.
- \* If already at end-of-file, readline and read return an empty string.
- \* file\_obj.readlines() reads all remaining
  lines of text returning them as a list of strings.

## File position

- \* A file is sequence of bytes.
  - But the file object is not a sequence type!
- The file object keeps track of where in the file to read (or write) next.
  - The next read operation (or iteration) starts from the current position.
- When a file is opened for reading (mode 'r'), the starting position is 0 (beginning of the file).
- \* File position is *not* the line number.

- \* Suppose "notes.txt" contains:
  - First line

Second line

last line

★ Then

- >> fo = open("notes.txt", "r")
  >> fo.read(4)
  'Firs'
  >> fo.readline()
  't line\n'
  >> fo.readlines()
  - ['Second line\n', 'last line\n']

#### Iterating through a file

- \* python's text file objects are *iterable*.
- \* Iterating yields one line at time.

my\_file = open("notes.txt", "r")
line\_num = 1
for line in my\_file:
 print(line\_num, ':', line)
 line\_num = line\_num + 1
my\_file.close()

#### Programming problem

- \* Read a python source code file, and
  - print each line;
  - prefix each line of *code* with a line number;
  - for numbering, count only lines containing code (not empty lines, or lines with only comments).

## Writing text files

- Access mode 'w' (or 'a') opens a file for writing (text).
- \* file\_obj.write(string) writes the string
   to the file.
  - Note: write does not add a newline to the end of the string.
- \* print(..., file=file\_obj) prints to the specified file instead of the terminal.

## Buffering

- ★ File objects typically have an I/O buffer.
  - Writing to the file object adds data to the buffer; when full, all data in it is written to the file ("flushing" the buffer).
- \* Closing the file flushes the buffer.
  - If the program stops without closing an output file, the file may end up incomplete.
- \* Always close the file when done!
