

COMP1730 & COMP6730

### Introductions Co-convenors

Semester 1, 2024:

# Course structure

	National University
Week 1 – Programming Basics, Variables and Expressions	
<ul> <li>Week 2 – Functions and abstraction</li> </ul>	
<ul> <li>Week 3 – Code branching and Iteration, Strings</li> </ul>	
<ul> <li>Week 4 – Lists (Canberra Day holiday on the Monday)</li> </ul>	Dan
<ul> <li>Week 5 – References, Dictionaries, Code best practices</li> </ul>	Dun
<ul> <li>Week 6 – Modules, Classes, File IO</li> </ul>	
Teaching break	
<ul> <li>Week 7 – Introduction to scientific libraries with NumPy, Debugging</li> </ul>	
<ul> <li>Week 8 – Data analysis with Pandas, Visualisation, Dictionaries, Sets</li> </ul>	
<ul> <li>Week 9 – Advanced functions, Errors and exceptions</li> </ul>	
<ul> <li>Week 10 – Computational complexity, Dynamic programming</li> </ul>	Brian
<ul> <li>Week 11 – Computational methods in science and engineering</li> </ul>	Dildii
<ul> <li>Week 12 – Computational methods (cont), Exam revision</li> </ul>	

# Lecture slides and code examples:

Australian National University

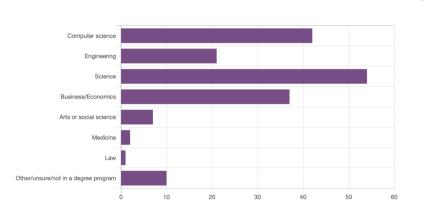

• Course website:

Australian

https://comp.anu.edu.au/courses/comp1730/lectures/

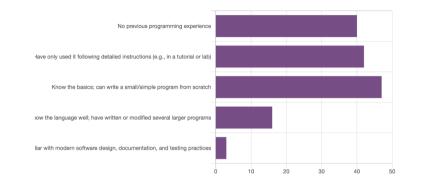

See: https://comp.anu.edu.au/courses/comp1730/lectures/

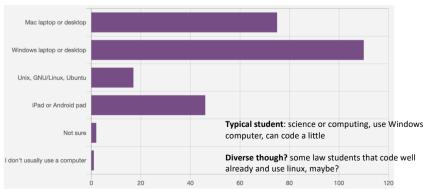

# About you – results of demographic survey

# About you – results of demographic survey

# About you – results of demographic survey

### Introductory Lecture - format

- Orientation to python let's look at some code first
- Learning to program
- Reference books and other reading
- Variables and Expressions (part I)

### AND (at the end):

- Admin:
  - Lab class enrolments
  - Assessment
  - Other announcements

### Hello, World!

Hello, world!

Australian National University

- Brian Kernighan, of C fame, is attributed to be responsible for the first 'Hello, world!' program.
- It is much simpler to implement this in Python than C for the early 1970's

In C:	<pre>main( ) {     extern a, b, c;     putchar(a); putchar(b); putchar(c); pu }</pre>	tchar('!*n');	2
	a 'hell'; b 'o, w'; c 'orld';	Source: Wikipedia	Ì
In Pytho	n (in the interpreter interactive mode):		
	<pre>In [1]: print("Hello, world!")</pre>		

Brian Kernighan, ca. 1972

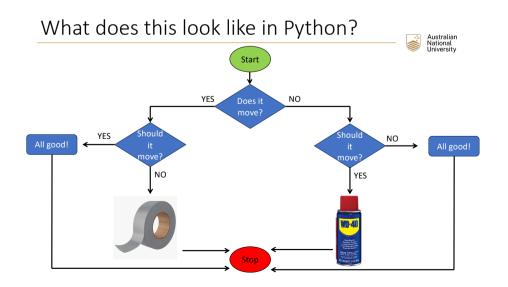

### Example: Running python programs?

Australian National University

### • Code\_L1\_1.py

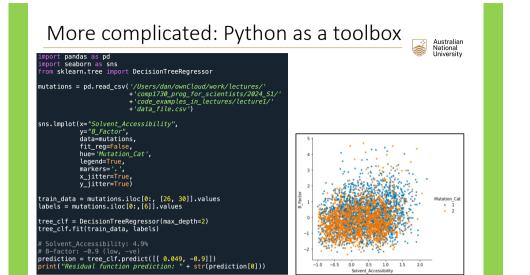

- Interactive mode python
- Script mode files that end with \*.py
- Running in a terminal
- Running in an Integrated Development Environment

### 

advice\_response\_str = advice\_bot(response1, response2)

rint("Solution: " + advice\_response\_str + "!")

# What is programming?

COMP1730 & COMP6730

Reading: Chapter 1: Downey, *Think Python,* Chapter 1: Sundnes, *ItSPwP OR* Sections 1& 2: https://docs.python.org/3/tutorial/index.html

## Why Python?

- This is not a course on programming in python. It is a course on programming that uses python
- Why python?
  - Python is a very popular programming language
     Especially in science and engineering
  - Open source, available on most platforms
  - Huge external code libraries for doing just about everything, in:
    - Data Science
    - Machine Learning
    - Bioinformatics...
- We will use python 3 (beware older books that are python 2)

Python creator, Guido van Rossum in 2019

## This course

Australian National University

> Australian National University

- Is a first course in programming, in python
  - Focused in transferable, practical skills
  - Coding languages come and they go but the good coding practice is relevant to all languages
  - Useful to those in science and engineering.
  - Not foremost teaching commercial software engineering
- A beginners course no prior experience required. But this doesn't mean we are going to go slowly, or that it will be easy!
- We will use python 3

### Coding as a craft

Australian National University

- Some recommendations:
  - Read widely and write code frequently. Practice, practice, practice.
  - This won't end well if it is already week 9 and this is the first time you are looking at the course.
  - *Textbooks and reading*: if you only attend one part of this course, make sure it is the tutorials. Though, these will be very hard if you don't at least attend lectures or do the course reading
  - In the beginning, as you start to write your first programs, it might feel bad as you make all the beginners mistakes. Don't worry and keep trying. Everyone starts here.
  - Error messages are your friend...

Alex Downey (2016) Think Python, 2<sup>nd</sup> Edition

**Reading:** Course Textbooks

Sundnes (2020) Introduction to Scientific Programming with Python (ItSPwP) (electronic copies available at: https://comp.anu.edu.au/courses/comp1730/resources/)

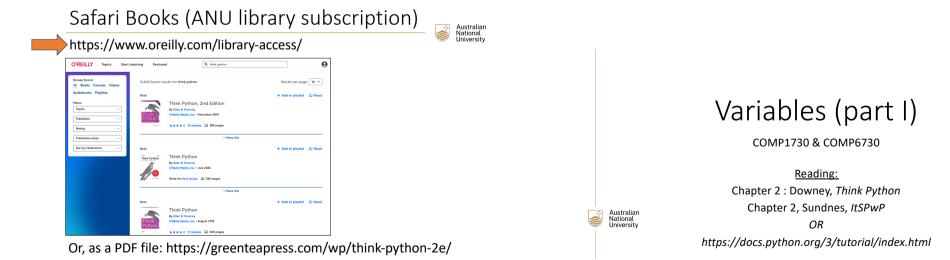

Australian

National

• Other good resources: https://docs.python.org/3/tutorial/index.html

 Other books: Al Sweigart (2015) Automate the Boring Stuff with Python Bill Lubanovic (2019) Introducing Python, 2<sup>nd</sup> Edition

- When reading other python books, make sure they are python 3!
- Be careful with web resources some are great (eg. docs.python.org). Many aren't.

### Variables – what are they?

Australian National University

- · Contain a program's data whilst it is executing
- Assignment statements:

Code\_L1\_4.py

>>> message = 'And now for something completely different'
>>> n = 17
>>> pi = 3.141592653589793

Downey (2015) Think Python, 2<sup>nd</sup> Ed.

• In memory – the 'state' of the program:

message $\longrightarrow$ 'And now for something completely different'
n → 17
pi —> 3.1415926535897932
Figure 2-1. State diagram.

### Types of variables (in python)

- All variables have a type and you will get an error is you store an incompatible value in the wrong type (eg. a string value in an integer variable type)
- Or try to do something inappropriate with a data type (eg, print an integer as a string)
- Basic data types:
  - int integer
  - float decimal values
  - str strings of one or more characters
  - bool Boolean values, True or False
- And variables that contain multiple values of basic data types:
  - List and Tuple sequences an index
  - Dict a hash, key-value pairs

Table 1-2: Common Data Types				
Data type	Examples			
Integers	-2, -1, 0, 1, 2, 3, 4, 5			
Floating-point numbers	-1.25, -1.0, -0.5, 0.0, 0.5, 1.0, 1.25			
Strings	'a', 'aa', 'aaa', 'Hello!', '11 cats'			

Sweigart (2019) Automate the Boring Stuff with Python, 2<sup>nd</sup> Ed.

Australiar National University

#### Every variable has a type Australian National Universit • The type () function tells us the Variable types in python: type of a variable: • Integers (type int) • Floating-point numbers (type float) 0... python • Text strings (type str) sh-3.2\$ pvthon thon 3.9.13 (main, Aug 25 2022, 18:29:29) • Truth or Boolean values (type bool) Clang 12.0.0 ] :: Anaconda, Inc. on darwin ype "help", "copyright", "credits" or "license" for more information type(2) ass 'int' Variable types determine what we lass 'float type("zero' can do with values (and sometimes ass 'str' type("1") what the result is) ass 'str' > type(1 < 0) lass 'bool'> > type(False) lass 'bool': Code\_L1\_5.py

### Numeric types: int

- int types represent the mathematical integers (positive and negative whole numbers) (0, 1, 2, -1, -17, 4096,...)
- Values of type int have no inherent size limit in python

- Note: can't use commas to format integers for readability
  - Write 128736 not 1, 282, 736

## Numeric types: float

Australian National University

- Floating-point numbers (type float) approximate the mathematical real numbers
- Values of type float have limited range and limited precision
  - Min/max ± 1.79 x 10<sup>308</sup>
  - With a few exceptions to this limit
  - Though this is the typical limit the actual limits depend on the python implementation
- Type float also has special values ± inf (infinity) and nan (not a number)

### String variables

- Strings (type str) represent text
- A string literal is enclosed in single or double quote marks

```
>>> "Hello world"
'Hello world'
>>> '4" long'
'4" long'
```

• A string (in python) can contain other types of quote mark, but not the one used to **delimit** it

Australian

National

• More about strings (so much more) in a coming lecture

### Suggested Exercises

Australian National University

• Complete Exercises 2-1 and 2-2 on Page 18 & 19 of Think Python.

Course Organisation

COMP1730 & COMP6730

## Course Admin, Information and Contacts

- https://comp.anu.edu.au/courses/comp1730/
- Wattle for announcements, forums, quizzes, surveys and assignment submission
- Recordings of lectures are available on Wattle
- Read the Wattle news and announcements!
- To ask a question:
  - Use the discussion forum on Wattle
  - Ask your tutor in labs
  - For private matters, use the course email: <u>comp1730@anu.edu.au</u>
  - Always use your ANU email address, to avoid the spam filters
  - Please don't email the course convenors directly these emails will be ignored

### Schedule overview

- Two lectures per week
- All lectures will be presented live and will be recorded
- Follow content and schedule: <u>https://comp.anu.edu.au/courses/comp1730/lectures/</u>
- One 2-hour lab per week, starting from Week 2
  - Before Fri 23<sup>rd</sup> Feb Sign-up for a lab class with MyTimetable (linked via Wattle): <u>https://mytimetable.anu.edu.au/odd/student</u>
- Assessments will be due at 11:55pm on Sunday of weeks when due (unless otherwise specified): https://comp.anu.edu.au/courses/comp1730/assessments/
- You are expected to spend another 6 hours per week studying the course:
  - doing the recommended reading
  - solving all lab exercises, and
  - time spent to practice coding

### **Drop-In Sessions**

Australian National University

University

- As of this semester, we are continuing weekly drop-in sessions for 1to-1 tutor contact
- Times will be announced in later in 1<sup>st</sup> Term
- Python installation help sessions:
  - Tues 3-5pm Birch Building, Lab 1.08
  - Weds 4-6pm Hanna Neumann Bldg, Computer Lab 1.24
  - Thurs 11am-1pm room N114, CSIT Building (#108)

### Assessment (preliminary)

Component/Link	Weight	Release date	Due date/Exam date
Homework 1	3%	26/02/2024 (Wk 2)	03/03/2024, 23:55PM
Homework 2	3%	04/03/2024 (Wk 3)	10/03/2024, 23:55PM
Homework 3	3%	18/03/2024 (Wk 5)	23/03/2024, 23:55PM
Homework 4	3%	25/03/2024 (Wk 6)	14/04/2024, 23:55PM
Homework 5	3%	15/04/2024 (Wk 7)	21/04/2024, 23:55PM
Project Assignment	35%	22/04/2024 (Wk 8)	10/05/2024, 23:55PM (Fri Wk 10)
In-lab project assessment	Mandatory discussions with a tutor in weeks 11 & 12 following the due date. If absent, your project mark will be zero.		
Final Exam	50%	N/A	ТВА

See: https://comp.anu.edu.au/courses/comp1730/assessments/

- Final exam:
  - In-person, in computing labs
  - COMP1730 & COMP6730 at different times
  - Not a hurdle assessment

- \_\_\_\_\_
- Assignment:
  - Individual assignment is a takehome programming assignment
  - There will be a *viva* component of the assignment assessment
    - Held during weeks 11 and 12 at same times as your usual lab session

Australia

National

Australian National University

- Students are expected to have a thorough knowledge of their own work and be able to speak in detail about their answers and solutions
- The assessment scheme will be final at end of Week 2. Any changes will be announced.

### Academic honesty

- Submitted code will be checked computationally for evidence of plagiarism.
- If evidence of plagiarism is found in individual homework problems, the mark for that individual homework will not be
  posted, until all homeworks have been assessed. In the context of all homeworks if it is decided there is evidence of
  repeated plagiarism, students will be interviewed for possible action of academic misconduct.
- The take-home assignment and exam will also be checked for evidence of academic misconduct.
- What is okay: for the homework, discussing the programming problems and approaches to solve them with other students is allowed, provided that no code is exchanged and that the final solution and code is written individually. In this case, the other students involved in the discussion must be listed in a comment at the top of the homework.
- For the final exam and take-home assignment must be individual work. You may not discuss the questions or your
  answers with anyone (this includes any on-line forum).
- Note that in all cases every line of code submitted must be fully written by you from scratch (and not just a modified copy of a version from the internet), and must be fully understood and explainable by you. Sufficient inline comments should be provided to make clear that you understand the code.
- Note on large language models and other code generators: generative AI models such as github copilot, chatGPT, Bing
  chatbot etc can be used by students for the homeworks and take-home assignment to explore solutions and
  understand their own code. They will not be allowed for the final exam. But in all cases the final code submitted by the
  student must be fully written and understood by the student, as described above.
- · If you are unsure, please ask your tutor or the convenors.

### Assessment

- All assignment deadlines are hard no late submissions will be accepted. Unless previous permission has been granted.
- Extension requests and late submissions require documentary evidence, such as a medical certificate
- Regarding deferred assessments and special consideration, please read: <u>https://www.anu.edu.au/students/program-</u> administration/assessments-exams
- Please note that "any submitted work may be subject to an additional oral examination", which can change the assessment mark in any way.

### Useful Links:

- Install python if you want to start, follow the instructions to install python (via Anaconda) on your laptop: https://comp.anu.edu.au/courses/comp1730/labs/install/
- Lab materials this is where to find the labs: https://comp.anu.edu.au/courses/comp1730/labs/
- And the assessment description:

https://comp.anu.edu.au/courses/comp1730/assessments/

### Wattle Discussion forum

### In general, this is where you should go to ask questions

### 3 simple rules:

- 1. Read before you post.
  - Before posting a question, check if your question has already been answered
- 2. Give you post a good, descriptive topic
  - Don't write 'A question'. Write something like 'Variable assignment: why does the value not change?'
- 3. You may not post solutions to assignment problems

These rules are good etiquette and apply to any online forum.

### Important tasks:

Australian National University

- 1. Complete the **demographic information questionnaire** on course Wattle page
- 2. Sign up to a lab class!
  - Do this via myTimetable: <u>https://mytimetable.anu.edu.au/odd/student</u>
  - Link also accessible from Wattle page
  - Do this by end of Week 1 (Fri 23rd Feb)
  - Labs start in Week 2
  - Homework 1 is also due in Week 2
  - In-lab assessment starts in Week 2
- 3. Login to STREAMS: <u>https://cs.anu.edu.au/streams/</u>
  - This will create an account for you on the lab computers

- Prepare for the labs! Attend lectures, read lab instructions – and attempt some of the exercises <u>before</u> attending your lab
- 5. Make sure you have a working python programming environment:
  - Install Anaconda on your own computer:
  - Go to: https://www.anaconda.com/download
  - Current installation will give you python 3.9 or later
  - Includes that Spyder IDE as part of installation
    For more tips and detailed instructions:
  - https://comp.anu.edu.au/courses/comp1730/labs/install/
    Or, install another python3 implementation
  - Or, verify that you can reliably use the lab computers
