Mutual Exclusion

Problem specification

The general mutual exclusion scenario

- N processes execute (infinite) instruction sequences concurrently.
Each instruction belongs to either a *critical* or *non-critical* section.

☞ Safety property '**Mutual exclusion**':

Instructions from *critical sections* of two or more processes
must never be interleaved!

- More required properties:
 - **No deadlocks:** If one or multiple processes try to enter their critical sections then *exactly one* of them *must succeed*.
 - **No starvation:** *Every process* which tries to enter one of his critical sections *must succeed eventually*.
 - **Efficiency:** The decision which process may enter the critical section must be made *efficiently* in all cases, i.e. also when there is no contention in the first place.

Mutual Exclusion

Problem specification

The general mutual exclusion scenario

- N processes execute (infinite) instruction sequences concurrently.
Each instruction belongs to either a *critical* or *non-critical* section.

☞ Safety property '**Mutual exclusion**':

Instructions from *critical sections* of two or more processes
must never be interleaved!

- Further assumptions:
 - Pre- and post-protocols *can be executed* before and after each critical section.
 - Processes *may delay infinitely* in **non-critical** sections.
 - Processes *do not delay infinitely* in **critical** sections.

Mutual Exclusion

Mutual exclusion: Atomic load & store operations

Atomic load & store operations

- ☞ Assumption 1: every individual base memory cell (word) load and store access is *atomic*
- ☞ Assumption 2: there is *no* atomic combined load-store access

G : Natural := 0; -- assumed to be mapped on a 1-word cell in memory

```
task body P1 is
begin
  G := 1
  G := G + G;
end P1;
```

```
task body P2 is
begin
  G := 2
  G := G + G;
end P2;
```

```
task body P3 is
begin
  G := 3
  G := G + G;
end P3;
```

- ☞ What is the value of G?

Mutual Exclusion

Mutual exclusion: Atomic load & store operations

Atomic load & store operations

- ☞ Assumption 1: every individual base memory cell (word) load and store access is *atomic*
- ☞ Assumption 2: there is *no* atomic combined load-store access

G : Natural := 0; -- assumed to be mapped on a 1-word cell in memory

```
task body P1 is  
begin  
  G := 1  
  G := G + G;  
end P1;
```

```
task body P2 is  
begin  
  G := 2  
  G := G + G;  
end P2;
```

```
task body P3 is  
begin  
  G := 3  
  G := G + G;  
end P3;
```

- ☞ After the first global initialisation, G can have **almost any value** between 0 and 24
- ☞ After the first global initialisation, G will have **exactly one** value between 0 and 24
- ☞ After all tasks terminated, G will have **exactly one** value between 2 and 24

Mutual Exclusion

Mutual exclusion: First attempt

```
type Task_Token is mod 2;
Turn: Task_Token := 0;

task body P0 is
begin
loop
    ----- non_critical_section_0;
    loop exit when Turn = 0; end loop;
    ----- critical_section_0;
    Turn := Turn + 1;
end loop;
end P0;

task body P1 is
begin
loop
    ----- non_critical_section_1;
    loop exit when Turn = 1; end loop;
    ----- critical_section_1;
    Turn := Turn + 1;
end loop;
end P1;
```

- ☞ Mutual exclusion?
- ☞ Deadlock?
- ☞ Starvation?
- ☞ Work without contention?

Mutual Exclusion

Mutual exclusion: First attempt

```
type Task_Token is mod 2;
Turn: Task_Token := 0;

task body P0 is
begin
loop
    ----- non_critical_section_0;
    loop exit when Turn = 0; end loop;
        ----- critical_section_0;
        Turn := Turn + 1;
    end loop;
end P0;
```

```
task body P1 is
begin
loop
    ----- non_critical_section_1;
    loop exit when Turn = 1; end loop;
        ----- critical_section_1;
        Turn := Turn + 1;
    end loop;
end P1;
```

- ☞ Mutual exclusion!
- ☞ No deadlock!
- ☞ No starvation!
- ☞ Locks up, if there is no contention!

Mutual Exclusion

Mutual exclusion: First attempt

```
type Task_Token is mod 2;
Turn: Task_Token := 0;

task body P0 is
begin
loop
    ----- non_critical_section_0;
    loop exit when Turn = 0; end loop;
    ----- critical_section_0;
    Turn := Turn + 1;
end loop;
end P0;
```

```
task body P1 is
begin
loop
    ----- non_critical_section_1;
    loop exit when Turn = 1; end loop;
    ----- critical_section_1;
    Turn := Turn + 1;
end loop;
end P1;
```

- ☞ Mutual exclusion!
- ☞ No deadlock!
- ☞ No starvation!
- ☞ Inefficient!

scatter:

```
if Turn = myTurn then
    Turn := Turn + 1;
end if
```

into the non-critical sections

Mutual Exclusion

Mutual exclusion: Second attempt

```
type Critical_Section_State is (In_CS, Out_CS);
C1, C2: Critical_Section_State := Out_CS;

task body P1 is
begin
loop
----- non_critical_section_1;
loop
    exit when C2 = Out_CS;
end loop;
C1 := In_CS;
----- critical_section_1;
C1 := Out_CS;
end loop;
end P1;

task body P2 is
begin
loop
----- non_critical_section_2;
loop
    exit when C1 = Out_CS;
end loop;
C2 := In_CS;
----- critical_section_2;
C2 := Out_CS;
end loop;
end P2;
```

☞ Any better?

Mutual Exclusion

Mutual exclusion: Second attempt

```
type Critical_Section_State is (In_CS, Out_CS);
C1, C2: Critical_Section_State := Out_CS;

task body P1 is
begin
loop
----- non_critical_section_1;
loop
    exit when C2 = Out_CS;
end loop;
C1 := In_CS;
----- critical_section_1;
C1 := Out_CS;
end loop;
end P1;

task body P2 is
begin
loop
----- non_critical_section_2;
loop
    exit when C1 = Out_CS;
end loop;
C2 := In_CS;
----- critical_section_2;
C2 := Out_CS;
end loop;
end P2;
```

☒ No mutual exclusion!

Mutual Exclusion

Mutual exclusion: Third attempt

```
type Critical_Section_State is (In_CS, Out_CS);
C1, C2: Critical_Section_State := Out_CS;

task body P1 is
begin
loop
    ----- non_critical_section_1;
    C1 := In_CS;
    loop
        exit when C2 = Out_CS;
    end loop;
    ----- critical_section_1;
    C1 := Out_CS;
    end loop;
end P1;

task body P2 is
begin
loop

end One_Of_Two_Tasks;
```

Mutual Exclusion

Problem specification

The general mutual exclusion scenario

- N processes execute (infinite) instruction sequences concurrently.
Each instruction belongs to either a *critical* or *non-critical* section.

☞ Safety property '**Mutual exclusion**':

Instructions from *critical sections* of two or more processes
must never be interleaved!

- More required properties:
 - **No deadlocks:** If one or multiple processes try to enter their critical sections then *exactly one* of them *must succeed*.
 - **No starvation:** *Every process* which tries to enter one of his critical sections *must succeed eventually*.
 - **Efficiency:** The decision which process may enter the critical section must be made *efficiently* in all cases, i.e. also when there is no contention.

Mutual Exclusion

Mutual exclusion: Bakery Algorithm

The idea of the Bakery Algorithm

A set of N Processes $P_1 \dots P_N$ competing for mutually exclusive execution of their critical regions. Every process P_i out of $P_1 \dots P_N$ supplies: a globally readable number t_i ('ticket') (initialized to '0').

- Before a process P_i enters a critical section:
 - P_i draws a new number $t_i > t_j ; \forall j \neq i$
 - P_i is allowed to enter the critical section iff: $\forall j \neq i : t_i < t_j$ or $t_j = 0$
- After a process left a critical section:
 - P_i resets its $t_i = 0$

Issues:

- ☞ Can you ensure that processes won't read each others ticket numbers while still calculating?
- ☞ Can you ensure that no two processes draw the same number?

Mutual Exclusion

Mutual exclusion: Bakery Algorithm

```
No_Of_Tasks : constant Positive := ...;
type Task_Range is mod No_Of_Tasks;
Choosing : array (Task_Range) of Boolean := (others => False);
Ticket    : array (Task_Range) of Natural   := (others => 0);

task type P (this_id: Task_Range);
task body P is
begin
loop
----- non_critcal_section_1;
Choosing (this_id) := True;
Ticket (this_id) := Max (Ticket) + 1;
Choosing (this_id) := False;
for id in Task_Range loop
if id /= this_id then
loop
exit when not Choosing (id);
end loop;
loop
exit when not Choosing (id);
end loop;
----- critical_section_1;
Ticket (this_id) := 0;
end loop;
end if;
end loop;
----- critical_section_1;
Ticket (this_id) := 0;
end loop;
end P;
```

Mutual Exclusion

Mutual exclusion: Bakery Algorithm

```
No_Of_Tasks : constant Positive := ...;
type Task_Range is mod No_Of_Tasks;
Choosing : array (Task_Range) of Boolean := (others => False);
Ticket   : array (Task_Range) of Natural  := (others => 0);

task type P (this_id: Task_Range);
task body P is
begin
loop
----- non_critcal_section_1;
Choosing (this_id) := True;
Ticket (this_id) := Max (Ticket (this_id), this_id);
Choosing (this_id) := False;
----- critical_section_1;
for id in Task_Range loop
if id /= this_id then
loop
exit when not Choosing (id);
end loop;
----- non_critcal_section_1;
Choosing (id) := True;
Ticket (id) := Ticket (id) + 1;
Choosing (id) := False;
----- critical_section_1;
Ticket (this_id) := 0;
end loop;
end P;
```

Mutual exclusion!

No deadlock!

No starvation!

No livelock!

Works for N processes!

Extensive and communication intensive protocol (even if there is no contention)

Mutual Exclusion

Beyond atomic memory access

Realistic hardware support

Atomic **test-and-set** operations:

- $[L := C; C := 1]$

Atomic **exchange** operations:

- $[Temp := L; L := C; C := Temp]$

Memory cell **reservations**:

- $L \stackrel{R}{:=} C$; – read by using a *special instruction*, which puts a ‘reservation’ on C
- ... calculate a <new value> for C ...
- $C \stackrel{T}{:=} \langle \text{new value} \rangle$;
 - succeeds iff C was not manipulated by other processors or devices since the reservation

Mutual Exclusion

Mutual exclusion: atomic test-and-set operation

```
type Flag is Natural range 0..1; C : Flag := 0;
```

```
task body Pi is
```

```
L : Flag;
```

```

```

Any context switch
needs to clear
reservations

```
task body Pj is
  L : Flag;
begin
  loop
    loop
      L := C; C := 1;
      exit when Untouched and L = 0;
      ----- change process
    end loop;
    ----- critical_section_j;
    C := 0;
  end loop;
end Pj;
```

☞ Mutual exclusion!, No deadlock!, No global live-lock!

☞ Works for any dynamic number of processes.

☞ Individual starvation possible! Busy waiting loops!

Mutual Exclusion

Mutual exclusion ... or the lack thereof

```
Count : Integer := 0;
```

```
task body Enter is
begin
  for i := 1 .. 100 loop
    Count := Count + 1;
  end loop;
end Enter;
```

```
task body Leave is
begin
  for i := 1 .. 100 loop
    Count := Count - 1;
  end loop;
end Leave;
```

☞ What is the value of Count after both programs complete?

```
Count: .word 0x00000000
```

```
ldr r4, =Count
```

```
mov r1, #1
```

for_enter:

```
cmp r1, #100
```

```
bgt end_for_enter
```

```
ldr r4, =Count
```

```
mov r1, #1
```

for_leave:

```
cmp r1, #100
```

```
bgt end_for_leave
```

Negotiate who goes first

Asks for forgiveness

☞ Light weight solution – sometimes referred to as “lock-free” or “lockless”.

Mutual Exclusion

Beyond atomic hardware operations

Semaphores

Basic definition (Dijkstra 1968)

Assuming the following three conditions on a shared memory cell between processes:

- a set of processes agree on a variable **S** operating as a flag to indicate synchronization conditions
- an atomic operation **P** on **S** – for ‘passeren’ (Dutch for ‘pass’):
P(S): [as soon as $S > 0$ then $S := S - 1$] ↗ this is a potentially delaying operation
- an atomic operation **V** on **S** – for ‘vrygeven’ (Dutch for ‘to release’):
V(S): [$S := S + 1$]

↗ then the variable **S** is called a **Semaphore**.

Mutual Exclusion

Beyond atomic hardware operations

Semaphores

... as supplied by operating systems and runtime environments

- a set of processes $P_1 \dots P_N$ agree on a variable S operating as a flag to indicate synchronization conditions
- an atomic operation **Wait** on S : (aka ‘Suspend_Until_True’, ‘sem_wait’, ...)

Process P_i : **Wait** (S):

```
[if  $S > 0$  then  $S := S - 1$ 
else suspend  $P_i$  on  $S$ ]
```

- an atomic operation **Signal** on S : (aka ‘Set_True’, ‘sem_post’, ...)

Process P_i : **Signal** (S):

```
[if  $\exists P_j$  suspended on  $S$  then release  $P_j$ 
else  $S := S + 1$ ]
```

☞ then the variable S is called a **Semaphore** in a scheduling environment.

Mutual Exclusion

Beyond atomic hardware operations

Semaphores

Types of semaphores:

- **Binary semaphores:** restricted to [0, 1] or [False, True] resp.
Multiple V (Signal) calls have the same effect than a single call.
 - Atomic hardware operations support binary semaphores.
 - Binary semaphores are sufficient to create all other semaphore forms.
- **General semaphores** (counting semaphores): non-negative number; (range limited by the system) P and V increment and decrement the semaphore by one.
- **Quantity semaphores:** The increment (and decrement) value for the semaphore is specified as a parameter with P and V.

☞ All types of semaphores must be initialized:
often the number of processes which are allowed inside a critical section, i.e. '1'.
