

Communication & Synchronization

Towards synchronization

Malicious use of "queueless semaphores"

```
with Ada.Synchronous_Task_Control; use Ada.Synchronous_Task_Control;
X, Y : Suspension_Object;

task B;
task body B is
begin
  ...
  Suspend_Until_True (Y);
  Set_True (X);
  ...
end B;
```

task A;
task body A is
begin
 ...
 Suspend_Until_True (X);
 Set_True (Y);
 ...
end A;

☞ Will result in a deadlock (assuming no other Set_True calls)

© 2020 Uwe R. Zimmer, The Australian National University page 272 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Towards synchronization

Malicious use of "queueless semaphores"

```
with Ada.Synchronous_Task_Control; use Ada.Synchronous_Task_Control;
X, Y : Suspension_Object;

task B;
task body B is
begin
  ...
  Suspend_Until_True (Y);
  Suspend_Until_True (X);
  ...
end B;
```

task A;
task body A is
begin
 ...
 Suspend_Until_True (X);
 Suspend_Until_True (Y);
 ...
end A;

☞ Will potentially result in a deadlock (with general semaphores) or a Program_Error in Ada.

Communication & Synchronization

Towards synchronization

Semaphores in POSIX

pshared is actually a Boolean indicating whether the semaphore is to be shared between processes

```
int sem_init      (sem_t *sem_location, int pshared, unsigned int value);
int sem_destroy   (sem_t *sem_location);
int sem_wait     (sem_t *sem_location);
int sem_trywait  (sem_t *sem_location);
int sem_timedwait (sem_t *sem_location, const struct timespec *abstime);
int sem_post     (sem_t *sem_location);
int sem_getvalue  (sem_t *sem_location, int *value);
```

*value indicates the number of waiting processes as a negative integer in case the semaphore value is zero

© 2020 Uwe R. Zimmer, The Australian National University page 274 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Towards synchronization

Semaphores in POSIX

```
sem_t mutex, cond[2];
typedef enum {low, high} priority_t;
int waiting;
int busy;

void allocate (priority_t P)
{
  sem_wait (&mutex);
  if (busy) {
    sem_post (&mutex);
    sem_wait (&cond[P]);
  }
  busy = 1;
  sem_post (&mutex);
}

void deallocate (priority_t P)
{
  sem_wait (&mutex);
  busy = 0;
  sem_getvalue (&cond[high], &waiting);
  if (waiting < 0) {
    sem_post (&cond[high]);
  } else {
    sem_getvalue (&cond[low], &waiting);
    if (waiting < 0) {
      sem_post (&cond[low]);
    } else {
      sem_post (&mutex);
    }
  }
}
```

Deadlock?
Livelock?
Mutual exclusion?

Communication & Synchronization

Towards synchronization

Semaphores in Java (since 2004)

```
Semaphore (int permits, boolean fair)
void acquire          ()           wait
void acquireUninterruptibly (int permits)    wait
boolean tryAcquire    ()           check and manipulate
boolean tryAcquire   (int permits, long timeout, TimeUnit unit)
int availablePermits ()           signal
protected void reducePermits (int reduction) administration
int drainPermits     ()           administration
void release         (int permits)    administration
protected Collection<Thread> getQueuedThreads ()
int getQueueLength   ()           administration
boolean hasQueuedThreads()
boolean isFair        ()           administration
String toString      ()           administration
```

Communication & Synchronization

Towards synchronization

Review of semaphores

- Semaphores are not bound to any resource or method or region
 - ☞ Compiler has no idea what is supposed to be protected by a semaphore.
- Semaphores are scattered all over the code
 - ☞ Hard to read and highly error-prone.
 - ☞ Adding or deleting a single semaphore operation usually stalls a whole system.
- Semaphores are generally considered inadequate for non-trivial systems.
 - (all concurrent languages and environments offer efficient and higher-abstraction synchronization methods)
- Special (usually close-to-hardware) applications exist.

© 2020 Uwe R. Zimmer, The Australian National University page 277 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Distributed synchronization

Conditional Critical Regions

Basic idea:

- Critical regions are a set of associated code sections in different processes, which are guaranteed to be executed in mutual exclusion:
 - Shared data structures are grouped in named regions and are tagged as being private resources.
 - Processes are prohibited from entering a critical region, when another process is active in any associated critical region.
- Condition synchronisation is provided by guards:
 - When a process wishes to enter a critical region it evaluates the guard (under mutual exclusion). If the guard evaluates to false, the process is suspended / delayed.
- Generally, no access order can be assumed ☞ potential livelocks

© 2020 Uwe R. Zimmer, The Australian National University page 278 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Distributed synchronization

Conditional Critical Regions

```
buffer : buffer_t;
resource critical_buffer_region : buffer;

process producer;
loop
  region critical_buffer_region
  when buffer.size < N do
    ----- place in buffer etc.
  end region;
end loop;
end producer;

process consumer;
loop
  region critical_buffer_region
  when buffer.size > 0 do
    ----- take from buffer etc.
  end region;
end loop;
end consumer;
```

© 2020 Uwe R. Zimmer, The Australian National University page 279 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Distributed synchronization

Review of Conditional Critical Regions

- Well formed synchronization blocks and synchronization conditions.
- Code, data and synchronization primitives are associated (known to compiler and runtime).
- All guards need to be re-evaluated, when any conditional critical region is left:
 - ☞ all involved processes are activated to test their guards
 - ☞ there is no order in the re-evaluation phase ☞ potential livelocks
- Condition synchronisation inside the critical code sections requires to leave and re-enter a critical region.
- As with semaphores the conditional critical regions are distributed all over the code.
 - ☞ on a larger scale: same problems as with semaphores.

The language Edison (Per Brinch Hansen, 1981) uses conditional critical regions for synchronization in a multiprocessor environment (each process is associated with exactly one processor.)

© 2020 Uwe R. Zimmer, The Australian National University page 280 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Centralized synchronization

Monitors

(Modula-1, Mesa — Dijkstra, Hoare)

Basic idea:

- Collect all operations and data-structures shared in critical regions in one place, the monitor.
- Formulate all operations as procedures or functions.
- Prohibit access to data-structures, other than by the monitor-procedures and functions.
- Assure mutual exclusion of all monitor-procedures and functions.

page 281 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Centralized synchronization

Monitors with condition synchronization

```
monitor buffer;
  export append, take;
  var BUF : array [..] of integer;
  top, base : 0..size-1;
  NumberInBuffer : integer;
  spaceavailable, itemavailable : condition;
procedure append (I : integer);
begin
  if NumberInBuffer = size then
    wait (spaceavailable);
  end if;
  BUF [top] := I;
  NumberInBuffer := NumberInBuffer + 1;
  top := (top + 1) mod size;
  signal (itemavailable)
end append;
```

© 2020 Uwe R. Zimmer, The Australian National University
page 284 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Centralized synchronization

Monitors in Modula-1

- procedure **wait** (s, r):
delays the caller until condition variable s is true (r is the rank (or 'priority') of the caller).
- procedure **send** (s):
If a process is waiting for the condition variable s, then the process at the top of the queue of the highest rank is activated (and the caller suspended).
- function **awaited** (s) return integer:
check for waiting processes on s.

page 287 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Centralized synchronization

Monitors

```
monitor buffer;
  export append, take;
  var (* declare protected vars *)
  procedure append (I : integer);
  begin
    (* initialisation *)
  end;
```

How to implement conditional synchronization?

© 2020 Uwe R. Zimmer, The Australian National University
page 282 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Centralized synchronization

Monitors with condition synchronization

(Hoare '74)

Hoare-monitors:

- Condition variables are implemented by semaphores (Wait and Signal).
- Queues for tasks suspended on condition variables are realized.
- A suspended task releases its lock on the monitor, enabling another task to enter.

☞ More efficient evaluation of the guards:
the task leaving the monitor can evaluate all guards and the right tasks can be activated.
☞ Blocked tasks may be ordered and livelocks prevented.

© 2020 Uwe R. Zimmer, The Australian National University
page 283 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Centralized synchronization

Monitors with condition synchronization

```
procedure take (var I : integer);
begin
  if NumberInBuffer = 0 then
    wait (itemavailable);
  end if;
  I := BUF [base];
  base := (base+1) mod size;
  NumberInBuffer := NumberInBuffer-1;
  signal (spaceavailable);
end take;
begin (* initialisation *)
  NumberInBuffer := 0;
  top := 0;
  base := 0;
end;
```

The signalling and the waiting process are both active in the monitor!

© 2020 Uwe R. Zimmer, The Australian National University
page 285 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Centralized synchronization

Monitors with condition synchronization

Suggestions to overcome the multiple-tasks-in-monitor-problem:

- A signal is allowed only as the *last action* of a process before it leaves the monitor.
- A signal operation has the side-effect of executing a *return statement*.
- Hoare, Modula-1, POSIX:
a signal operation which unblocks another process has the side-effect of *blocking* the current process; this process will only execute again once the monitor is unlocked again.
- A signal operation which unblocks a process does not block the caller, but the unblocked process must re-gain access to the monitor.

 **Communication & Synchronization**

Centralized synchronization

Monitors in Java

(by means of language primitives)

Considerations:

1. **Synchronized methods and code blocks:**
 - In order to implement a monitor all methods in an object need to be synchronized.
 - ☞ any other standard method can break a Java monitor and enter at any time.
 - Methods outside the monitor-object can synchronize at this object.
 - ☞ it is impossible to analyse a Java monitor locally, since lock accesses can exist all over the system.
 - Static data is shared between all objects of a class.
 - ☞ access to static data need to be synchronized with all objects of a class.

Synchronize either in static synchronized blocks: `synchronized (this.getClass()) {}` or in static methods: `public synchronized static <method> {}`

 **Communication & Synchronization**

Centralized synchronization

Monitors in Java

(multiple-readers-one-writer-example: usage of external conditional variables)

```
public class ReadersWriters {
    private int readers = 0;
    private int waitingReaders = 0;
    private int waitingWriters = 0;
    private boolean writing = false;
    ConditionVariable OkToRead = new ConditionVariable ();
    ConditionVariable OkToWrite = new ConditionVariable ();
    ...
}
```

© 2020 Uwe R. Zimmer, The Australian National University page 305 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

 **Communication & Synchronization**

Centralized synchronization

Monitors in Java

```
Monitor mon = new Monitor();
Monitor.Condition Condvar = mon.new Condition();

public void reader() throws InterruptedException {
    mon.enter();
    Condvar.await();
    ... read out protected data
    mon.leave();
}

public void writer() throws InterruptedException {
    mon.enter();
    ... write protected data
    Condvar.signal();
    mon.leave();
}
```

... the Java library monitor connects data or condition variables to the monitor by convention only!

© 2020 Uwe R. Zimmer, The Australian National University page 300 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

 **Communication & Synchronization**

Centralized synchronization

Monitors in Java

(by means of language primitives)

Java provides two mechanisms to construct a monitors-like structure:

- **Synchronized methods and code blocks:** all methods and code blocks which are using the synchronized tag are mutually exclusive with respect to the addressed class.
- **Notification methods:** wait, notify, and notifyAll can be used only in synchronized regions and are waking any or all threads, which are waiting in the same synchronized object.

© 2020 Uwe R. Zimmer, The Australian National University page 301 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

 **Communication & Synchronization**

Centralized synchronization

Monitors in Java

(by means of language primitives)

Considerations:

2. **Notification methods: wait, notify, and notifyAll**
 - wait suspends the thread and releases the local lock only
 - ☞ nested wait-calls will keep all enclosing locks.
 - notify and notifyAll do not release the lock!
 - ☞ methods, which are activated via notification need to wait for lock-access.
 - Java does not require any specific release order (like a queue) for wait-suspended threads
 - ☞ livelocks are not prevented at this level (in opposition to RT-Java).
 - There are no explicit conditional variables associated with the monitor or data.
 - ☞ notified threads need to wait for the lock to be released and to re-evaluate its entry condition.

© 2020 Uwe R. Zimmer, The Australian National University page 303 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

 **Communication & Synchronization**

Centralized synchronization

Monitors in Java

(by means of language primitives)

Standard monitor solution:

- declare the monitored data-structures private to the monitor object (non-static).
- introduce a class ConditionVariable:

```
public class ConditionVariable {
    public boolean wantToSleep = false;
}
```
- introduce synchronization-scopes in monitor-methods:
 - ☞ synchronize on the adequate conditional variables first and
 - ☞ synchronize on the adequate monitor-object second.
- make sure that all methods in the monitor are implementing the correct synchronizations.
- make sure that no other method in the whole system is synchronizing on or interfering with this monitor-object in any way ☞ by convention.

© 2020 Uwe R. Zimmer, The Australian National University page 304 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

 **Communication & Synchronization**

Centralized synchronization

Monitors in Java

(multiple-readers-one-writer-example: usage of external conditional variables)

```
public void StartWrite () throws InterruptedException {
    synchronized (OkToWrite) {
        synchronized (this) {
            if (writing | readers > 0) {
                waitingWriters++;
                OkToWrite.wantToSleep = true;
            } else {
                writing = true;
                OkToWrite.wantToSleep = false;
            }
        }
        if (OkToWrite.wantToSleep) OkToWrite.wait ();
    }
}
```

 **Communication & Synchronization**

Centralized synchronization

Monitors in Java

Per Brinch Hansen (1938-2007) in 1999:

Java's most serious mistake was the decision to use the sequential part of the language to implement the run-time support for its parallel features. It strikes me as absurd to write a compiler for the sequential language concepts only and then attempt to skip the much more difficult task of implementing a secure parallel notation. This wishful thinking is part of Java's unfortunate inheritance of the insecure C language and its primitive, error-prone library of threads methods.

"Per Brinch Hansen is one of a handful of computer pioneers who was responsible for advancing both operating systems development and concurrent programming from ad hoc techniques to systematic engineering disciplines." (from his IEEE 2002 Computer Pioneer Award)

 **Communication & Synchronization**

Centralized synchronization

Object-orientation and synchronization

Since mutual exclusion, notification, and condition synchronization schemes need to be designed and analyzed considering the implementation of all involved methods and guards:

- ☒ New methods cannot be added without re-evaluating the class!
- ☒ Re-use concepts of object-oriented programming do not translate to synchronized classes (e.g. monitors) and thus need to be considered carefully.
- ☒ The parent class might need to be adapted in order to suit the global synchronization scheme.
- ☒ Inheritance anomaly (Matsuoka & Yonezawa '93)

Methods to design and analyse expandable synchronized systems exist, yet they are complex and not offered in any concurrent programming language.
Alternatively, inheritance can be banned in the context of synchronization (e.g. Ada).

page 311 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

 **Communication & Synchronization**

Centralized synchronization

Monitors in POSIX, Visual C++, C#, Visual Basic & Java

- ☒ All provide lower-level primitives for the construction of monitors.
- ☒ All rely on convention rather than compiler checks.
- ☒ Visual C++, C+ & Visual Basic offer data-encapsulation and connection to the monitor.
- ☒ Java offers data-encapsulation (yet not with respect to a monitor).
- ☒ POSIX (being a collection of library calls) does not provide any data-encapsulation by itself.

☒ Extreme care must be taken when employing object-oriented programming and synchronization (incl. monitors)

© 2020 Uwe R. Zimmer, The Australian National University

page 312 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

 **Communication & Synchronization**

Centralized synchronization

Nested monitor calls

Assuming a thread in a monitor is calling an operation in another monitor and is suspended at a conditional variable there:

- ☒ the called monitor is aware of the suspension and allows other threads to enter.
- ☒ the calling monitor is possibly not aware of the suspension and keeps its lock!
- ☒ the unjustified locked calling monitor reduces the system performance and leads to potential deadlocks.

Suggestions to solve this situation:

- Maintain the lock anyway: e.g. POSIX, Java
- Prohibit nested monitor calls: e.g. Modula-1
- Provide constructs which specify the release of a monitor lock for remote calls, e.g. Ada

© 2020 Uwe R. Zimmer, The Australian National University

page 313 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

 **Communication & Synchronization**

Centralized synchronization

Criticism of monitors

- Mutual exclusion is solved elegantly and safely.
- Conditional synchronization is on the level of semaphores still
 - ☒ all criticism about semaphores applies inside the monitors

☒ Mixture of low-level and high-level synchronization constructs.

© 2020 Uwe R. Zimmer, The Australian National University

page 314 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

 **Communication & Synchronization**

Centralized synchronization

Synchronization by protected objects

Combine with the encapsulation feature of monitors to:

- ☒ Protected objects
 - All controlled data and operations are encapsulated.
 - Operations are mutual exclusive (with exceptions for read-only operations).
 - Guards (predicates) are syntactically attached to entries.
 - No protected data is accessible (other than by the defined operations).
 - Fairness inside operations is guaranteed by queuing (according to their priorities).
 - Fairness across all operations is guaranteed by the "internal progress first" rule.
 - Re-blocking provided by re-queuing to entries (no internal condition variables).

© 2020 Uwe R. Zimmer, The Australian National University

page 315 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

 **Communication & Synchronization**

Centralized synchronization

Synchronization by protected objects

(Simultaneous read-access)

Some read-only operations do not need to be mutually exclusive:

```

protected type Shared_Data (Initial : Data_Item) is
    function Read return Data_Item;
    procedure Write (New_Value : Data_Item);
private
    The_Data : Data_Item := Initial;
end Shared_Data_Item;

```

• protected functions can have 'in' parameters only and are not allowed to alter the private data (enforced by the compiler).

☒ protected functions allow simultaneous access (but mutual exclusive with other operations).

... there is no defined priority between functions and other protected operations in Ada.

© 2020 Uwe R. Zimmer, The Australian National University

page 316 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

 **Communication & Synchronization**

Centralized synchronization

Synchronization by protected objects

(Condition synchronization: entries & barriers)

Condition synchronization is realized in the form of **protected procedures** combined with boolean predicates (**barriers**): ↪ called **entries** in Ada:

```
Buffer_Size : constant Integer := 10;
type Index is mod Buffer_Size;
subtype Count is Natural range 0 .. Buffer_Size;
type Buffer_T is array (Index) of Data_Item;
protected type Bounded_Buffer is
    entry Get (Item : out Data_Item) when Num > 0 is
        begin
            Item := Buffer (First);
            First := First + 1;
            Num := Num - 1;
        end Get;
    entry Put (Item : Data_Item) when Num < Buffer_Size is
        begin
            Last := Last + 1;
            Buffer (Last) := Item;
            Num := Num + 1;
        end Put;
end Bounded_Buffer;
```

 **Communication & Synchronization**

Centralized synchronization

Synchronization by protected objects

(Operations on entry queues)

The count attribute indicates the number of tasks waiting at a specific queue:

```
protected type Broadcast is
    entry Receive (M: out Message);
    procedure Send (M: Message);
private
    New_Message : Message;
    Arrived : Boolean := False;
end Broadcast;
```

```
protected body Broadcast is
    entry Broadcast is
        entry Receive (M: out Message)
            when Arrived is
                begin
                    M := New_Message;
                    Arrived := Receive'count > 0;
                end Proceed;
        procedure Send (M: Message) is
            begin
                New_Message := M;
                Arrived := Receive'count > 0;
            end Send;
    end Broadcast;
```

 **Communication & Synchronization**

Centralized synchronization

Synchronization by protected objects

(Barrier evaluation)

Barrier in protected objects need to be evaluated only on two occasions:

- on creating a protected object, all barrier are evaluated according to the initial values of the internal, protected data.
- on leaving a protected procedure or entry, all potentially altered barriers are re-evaluated.

Alternatively an implementation may choose to evaluate barriers on those two occasions:

- on calling a protected entry, the one associated barrier is evaluated.
- on leaving a protected procedure or entry, all potentially altered barriers with tasks queued up on them are re-evaluated.

Barriers are not evaluated while inside a protected object or on leaving a protected function.

page 322 of 758 chapter 3: "Communication & Synchronization" up to page 369

 **Communication & Synchronization**

Centralized synchronization

Synchronization by protected objects

(Entry families, requeue & private entries)

Additional, essential primitives for concurrent control flows:

- Entry families:** A protected entry declaration can contain a discrete subtype **selector**, which can be evaluated by the barrier (other parameters cannot be evaluated by barriers) and implements an **array of protected entries**.
- Requeue facility:** Protected operations can use 'requeue' to redirect tasks to other **internal**, **external**, or **private** entries. The current protected operation is finished and the lock on the object is **released**. *Internal progress first*-rule: external tasks are only considered for queuing on barriers once no internally requested task can be progressed any further!
- Private entries:** Protected entries which are not accessible from outside the protected object, but can be employed as destinations for requeue operations.

Communication & Synchronization

Centralized synchronization

Synchronization by protected objects

(Restrictions for protected operations)

All code inside a protected procedure, function or entry is bound to non-blocking operations.

Thus the following operations are prohibited:

- entry call statements
- delay statements
- task creations or activations
- select statements
- accept statements
- ... as well as calls to sub-programs which contain any of the above

☞ The requeue facility allows for a potentially blocking operation, and releases the current lock!

page 335 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Current developments

Atomic operations in X10

X10 offers only atomic blocks in unconditional and conditional form.

- Unconditional atomic blocks are guaranteed to be non-blocking, which means that they cannot be nested and need to be implemented using roll-backs.
- Conditional atomic blocks can also be used as a pure notification system (similar to the Java notify method).
- Parallel statements (incl. parallel, i.e. unrolled loops).
- Shared variables (and their access mechanisms) are not defined.
- The programmer does not specify the scope of the locks (atomic blocks) but they are managed by the compiler/runtime environment.

Code analysis algorithms are required in order to provide efficiently, otherwise the runtime environment needs to associate every atomic block with a *global lock*.

page 336 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

High Performance Computing

Synchronization in large scale concurrency

High Performance Computing (HPC) emphasizes on keeping as many CPU nodes busy as possible:

- Avoid contention on sparse resources.
- Data is assigned to individual processes rather than processes synchronizing on data.
- Data integrity is achieved by keeping the CPU nodes in approximate "lock-step", yet there is still a need to re-sync concurrent entities.

Traditionally this has been implemented using the Message Passing Interface (MPI) while implementing separate address spaces.

- Current approaches employ partitioned address spaces, i.e. memory spaces can overlap and be re-assigned. Chapel, Fortress, X10.
- Not all algorithms break down into independent computation slices and so there is a need for memory integrity mechanisms in shared/partitioned address spaces.

© 2020 Uwe R. Zimmer, The Australian National University

page 337 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Current developments

Synchronization in Chapel

Chapel offers a variety of concurrent primitives:

- Parallel operations on data (e.g. concurrent array operations)
- Parallel statements (incl. parallel, i.e. unrolled loops)
- Parallelism can also be explicitly limited by serializing statements
- Atomic blocks for the purpose to construct atomic transactions
- Memory integrity needs to be programmed by means of synchronization statements (waiting for one or multiple control flows to complete) and/or atomic blocks

Further Chapel semantics are still forthcoming ... so there is still hope for a stronger shared memory synchronization / memory integrity construct.

Communication & Synchronization

Message-based synchronization

Message protocols

Asynchronous message

Neither the sender nor the receiver is blocked:

- Message is not transferred directly
- A buffer is required to store the messages
- Policy required for buffer sizes and buffer overflow situations

© 2020 Uwe R. Zimmer, The Australian National University

page 343 of 758 (chapter 3: "Communication & Synchronization" up to page 369)

Communication & Synchronization

Message-based synchronization

Message protocols

Asynchronous message (simulated by synchronous messages)

Introducing an intermediate process:

- Intermediate needs to be accepting messages at all times.
- Intermediate also needs to send out messages on request.

While processes are blocked in the sense of synchronous message passing, they are not actually delayed as the intermediate is always ready.

© 2020 Uwe R. Zimmer, The Australian National University

page 344 of 758 chapter 3: "Communication & Synchronization" up to page 369

Communication & Synchronization

Message-based synchronization

Message protocols

Remote invocation (simulated by asynchronous messages)

- Simulate two synchronous messages
- Processes are never actually synchronized

© 2020 Uwe R. Zimmer, The Australian National University

page 347 of 758 chapter 3: "Communication & Synchronization" up to page 369

Communication & Synchronization

Message-based synchronization

Synchronous vs. asynchronous communications

Purpose 'synchronization': ⇒ synchronous messages / remote invocations
Purpose 'last message(s) only': ⇒ asynchronous messages

⇒ Synchronous message passing in distributed systems requires hardware support.
⇒ Asynchronous message passing requires the usage of buffers and overflow policies.

Can both communication modes emulate each other?

© 2020 Uwe R. Zimmer, The Australian National University

page 350 of 758 chapter 3: "Communication & Synchronization" up to page 369

Communication & Synchronization

Message-based synchronization

Message protocols

Synchronous message (simulated by asynchronous messages)

Introducing two asynchronous messages:

- Both processes voluntarily suspend themselves until the transaction is complete.
- As no immediate communication takes place, the processes are never actually synchronized.
- The sender (but not the receiver) process knows that the transaction is complete.

© 2020 Uwe R. Zimmer, The Australian National University

page 345 of 758 chapter 3: "Communication & Synchronization" up to page 369

Communication & Synchronization

Message-based synchronization

Message protocols

Remote invocation (no results)

Shorter form of remote invocation which does not wait for results to be passed back.

- Still both processes are actually synchronized at the time of the invocation.

© 2020 Uwe R. Zimmer, The Australian National University

page 348 of 758 chapter 3: "Communication & Synchronization" up to page 369

Communication & Synchronization

Message-based synchronization

Message protocols

Remote invocation

- Delay sender or receiver until the first rendezvous point
- Pass parameters
- Keep sender blocked while receiver executes the local procedure
- Pass results
- Release both processes out of the rendezvous

© 2020 Uwe R. Zimmer, The Australian National University

page 346 of 758 chapter 3: "Communication & Synchronization" up to page 369

Communication & Synchronization

Message-based synchronization

Message protocols

Remote invocation (no results) (simulated by asynchronous messages)

- Simulate one synchronous message
- Processes are never actually synchronized

© 2020 Uwe R. Zimmer, The Australian National University

page 349 of 758 chapter 3: "Communication & Synchronization" up to page 369

Communication & Synchronization

Message-based synchronization

Synchronous vs. asynchronous communications

Purpose 'synchronization': ⇒ synchronous messages / remote invocations
Purpose 'last message(s) only': ⇒ asynchronous messages

⇒ Synchronous message passing in distributed systems requires hardware support.
⇒ Asynchronous message passing requires the usage of buffers and overflow policies.

Can both communication modes emulate each other?

- Synchronous communications are emulated by a combination of asynchronous messages in some systems (not identical with hardware supported synchronous communication).
- Asynchronous communications can be emulated in synchronized message passing systems by introducing a 'buffer-task' (de-coupling sender and receiver as well as allowing for broadcasts).

© 2020 Uwe R. Zimmer, The Australian National University

page 351 of 758 chapter 3: "Communication & Synchronization" up to page 369

Communication & Synchronization

Message-based synchronization

Addressing (name space)

Direct versus indirect:

```
send <message> to <process-name>
wait for <message> from <process-name>
send <message> to <mailbox>
wait for <message> from <mailbox>
```

Asymmetrical addressing:

```
send <message> to ...
wait for <message>
```

⇒ Client-server paradigm

© 2020 Uwe R. Zimmer, The Australian National University

Communication & Synchronization

Message-based synchronization

Message-based synchronization in Occam2

Communication is ensured by means of a 'channel', which:

- can be used by one writer and one reader process only
- and is synchronous:

```
CHAN OF INT SensorChannel:
PAR
  INT reading:
  SEQ i = 0 FOR 1000
  SEQ
    -- generate reading
    SensorChannel ! reading
  INT data:
  SEQ i = 0 FOR 1000
  SEQ
    SensorChannel ? data
    -- employ data
```

concurrent entities are synchronized at these points

Communication & Synchronization

Message-based synchronization

Message-based synchronization in CHILL

CHILL is the 'CCITT High Level Language',
where CCITT is the Comité Consultatif International Télégraphique et Téléphonique.

The CHILL language development was started in 1973 and standardized in 1979.

- strong support for concurrency, synchronization, and communication (monitors, buffered message passing, synchronous channels)

```
dcl SensorBuffer buffer (32) int;
...
send SensorBuffer (reading);
  (SensorBuffer in data) : ...
  esac;
signal SensorChannel = (int) to consumeratype;
...
send SensorChannel (reading)
  to consumer
  receive case
    (SensorChannel in data): ...
    esac;
```
