

Collections

J14

The Collections Framework
for Each
Ordering Collections

The Collections Framework

- Interfaces
 - Implementation-agnostic interfaces for collections
- Implementations
 - Concrete implementations
- Algorithms
 - Searching, sorting, etc.

Using the framework saves writing your own: better performance, fewer bugs, less work, etc.

The Collection Interface

- Basic operators
 - `size()`, `isEmpty()`, `contains()`, `add()`, `remove()`
- Traversal
 - `for-each()`, and iterators
- Bulk operators
 - `containsAll()`, `addAll()`, `removeAll()`, `retainAll()`, `clear()`
- Array operators
 - convert to and from arrays

Collection Types

- Primary collection types:
 - Set (no duplicates, mathematical set)
 - List (ordered elements)
 - Queue (shared work queues)
 - Map (<key, value> pairs)
- Each collection type is defined as an interface
 - You need to choose a concrete collection
 - Your choice will depend on your needs

Concrete Collection Types

	<i>Implemented Using</i>				
<i>Interfaces</i>	Hash table	Resizable array	Tree	Linked list	Hash table + linked list
Set	HashSet		TreeSet		LinkedHashSet
List		ArrayList		LinkedList	
Queue		ArrayDeque		LinkedList	
Map	HashMap		TreeMap		LinkedHashMap

Based on table from <http://docs.oracle.com/javase/tutorial/collections/implementations/index.html>

Four Commonly Used Collection Types

- `HashSet` implements a **set** as a hash table
 - Makes no ordering guarantees
- `ArrayList` implements a **list** using an array
 - Very fast access
- `HashMap` implements a **map** using a hash table
 - Makes no ordering guarantees
- `LinkedList` implements a **queue** using a linked list
 - First-in-first-out (FIFO) queue ordering

forEach

- Collections implement the `forEach` method, which applies an action to every element in the collection.

Instead of:

```
for (Thing t : things) {  
    System.out.println(t);  
}
```

You can do this:

```
things.forEach(t -> System.out.println(t));
```

Ordering Collections

- The `Comparable` interface defines a ‘natural’ ordering for all instances of a given type, `T`:

```
public interface Comparable<T> {  
    public int compareTo(T o);  
}
```

The return value is either negative, 0, or positive depending if the receiver comes before, equal, or after the argument, `o`.

- The `Comparator` interface allows a type `T` to be ordered in additional ways:

```
public interface Comparator<T> {  
    int compare(T o1, T o2);  
}
```

`Collections.sort()`

- No arguments
 - uses *natural* order for type
- Single Lambda argument:
 - uses order defined by lambda expression
 - `(a T, b T) -> { return <expression>; }`

Josh Bloch Item 25: Prefer lists to arrays

- Why?
 - Arrays are covariant, Generics are invariant
 - if A **extends** B, then A[] is a subclass of B[]
 - but List<A> has no relationship to List

```
// Fails at runtime!
Object[] objectArray = new Long[1];
objectArray[0] = "I don't fit in";           // Throws ArrayStoreException

// Won't compile!
List<Object> ol = new ArrayList<Long>(); // Incompatible types
ol.add("I don't fit in");
```
