

Implementing a DSL with Stratego

Len Hamey

This talk will describe the experience of implementing a domain specific language using Stratego to transform the source code to a general-purpose language. The Stratego implementation is compared with a much earlier implementation using compiler tools of the day. The talk will highlight some of the unexpected benefits of using Stratego, in particular the use of concrete syntax in conjunction with an intermediate language. This talk is an adaptation of a presentation given at LDTA by Shirley Goldrei.
